

Surrogate gain  $\Pi = \|L_\kappa D_z\|_F^2$  at initialization, rblapsum through\_rank\_kappa ( $b_0 = 0$ )

Boundary geometry and surrogate gain at initialization ( $b$  and  $\delta$  depend on  $K$  only, not on  $J$  or  $T$ )

boundary  $b = s_{(K+1)}$  (solid mean, dashed median)

rank spacing  $\delta = (s_{(K-4)} - s_{(K+4)})/8$

surrogate gain  $\Pi$  at  $T = 1$
